Transwarp ArgoDB Overview

ArgoDB is a distributed analytical database for enterprise data warehousing, real-time analytics and HTAP workloads. It supports standard SQL, lakehouse architecture, multi-model data and elastic scaling.

Typical scenarios:

- Enterprise data warehouse and BI reporting
- Real-time dashboards and risk analytics
- HTAP with high-concurrency point queries
- Disaster recovery and multi-tenant platforms

If the customer mainly needs a platform-level data lake with many components, evaluate TDH. If the workload is high-concurrency OLTP, evaluate KunDB.
